

Flip-flop seminar #4

3 December 2009

This seminar

- Review the STATA code for conducting a two-step multilevel analysis of data on over 1,5 million respondents in 449 Eurobarometer surveys from in 27 countries between 1975 and 2007
- The code with some explanations, a small practice data file and some level-2 results of interests (all coming from a paper that we are just finishing with Andrija) are uploaded to the Readings\STATA folder of the members-only section of our website

Next flip-flop event

- Time: 5:30 pm, 10 December 2009, FT809
- Topic: getting started with R and Tinn-R, with a focus on how R can help you deal with textual information (such as the content of an .htm file from the internet, or the ugly output of a statistical software like STATA or HLM or R), how you can extract content of interest from such sources and reorganize it into something useful (such as a nearly publication-quality table of regression results nicely formatted according to journal requirements)
